Overview

The objective of this document is to align the process on how to properly maintain the UST records for Electro. Electro Business Team are not technical savvy and can't regularly provide the UST data to maintain. Given this, L2 Team needs to step up and pro-actively maintain the data in the backend with synchronized process.

When do we need to maintain Electro UST records?

Electro UST records should be maintained when:

1. An Electro Store is maintained in the **Account** object.
    - Only when either of the fields *OwnerId, ebMobile__SalesRoute__c, AccountNumber, CallTarget__c* is updated.
2. A new Electro Store is created.
    - This is also being applied with a re-activated store and if Zakka store is changed to Electro Team Type.
3. Electro Store Master Data was uploaded (month end task).
    - Alongside with the Store MST, we should also pro-actively prepare and process an UST MST on our end.
4. After the Master Data month end task upload was deployed.
    - Post checking is needed to make sure that all Electro UST records are maintained properly in the month end task.

Why do we need to maintain Electro UST records?

The only reason why we need to maintain the Electro UST records is to make sure that all stores should only be mapped to the correct users.

As we all know, Electro stores are all automatically considered as non-sectorized stores. Meaning one store should only be mapped to one user, so a UST record should only exclusively correspond to a single store.

We still don't have the ability to do this automatedly in the system. Additionally, the development of this feature wherein a scheduled batch job should run and automatically maintain the UST records for Electro is still being pushed to eBest Team.

A. Few "pros" if we have a batch job to run

i. UST records are accurately maintained

ii. Prevent missing any unmaintained UST records

iii. It will save L2 Team time

How do we maintain Electro UST records?

We should all take note that UST records for Electro are only based on the data of a store from the **Account** object. What should be the data on a store should be exactly the data on the UST record.

IMPORTANT REMINDERS:

- ✓ We will only maintain the field in **UserStoreTerritory__c** that are initially maintained in the **Account** object. For example, if AccountNumber is the only field that was maintained in the **Account** object, then we should only maintain AccountNumber field in the **UserStoreTerritory__c** as well.
- ✓ Do not maintain more than one records together if different fields is required. This is to avoid unnecessary update on each field. For example, if business is requesting to maintain two stores but different fields is required (1st store is to maintain Account Number only and 2nd store is to maintain Monthly Call Target only) then separate uploads should be done for each record. This is for both **Account** and **UserStoreTerritory__c** objects.

A. Field Mapping Rules

Field Mappings	
Account Object	**UST Object**
ID	AccountId__c
AccountNumber	AccountNumber__c
CallTarget__c	MonthlyCallTarget__c
OwnerId	UserId__c
ebMobile__SalesRoute__c	UserCode__c
N/A	TerritoryMaster__c
N/A	TerritoryName

Table 1.0: Corresponding fields on Account Object vs UST Object

1. AccountNumber, AccountId__c, AccountNumber__c
   - If *AccountNumber* is maintained in the **Account** object, *AccountId__c* and *AccountNumber__c* in the **UST** object should mandatorily maintain as well.
   - If any maintenance was performed under **Account** object, the UST records should be **RE-CREATED AND NOT TO BE UPDATED**. Make sure that the existing UST records should be deactivated to make sure we won't encounter a duplicate store issue.
2. OwnerId, ebMobile__SalesRoute__c, UserId__C, UserCode__c
   - If *OwnerId* and *ebMobile__SalesRoute__c* is maintained in the **Account** object, *UserId__c* and *UserCode__c* in the **UST** object should also mandatorily maintain as well.
   - If any maintenance was performed under **Account** object, the UST records should be **RE-CREATED AND NOT TO BE UPDATED**. Make sure that the existing UST records should be deactivated to make sure we won't encounter a duplicate store issue.

3. CallTarget__c, MonthlyCallTarget__c
   - If *CallTarget__c* is maintained in the **Account** object, the *MonthlyCallTarget__c* in the **UST** object should also mandatorily maintain as well.
   - If any maintenance was performed under Account object, the UST record should be **UPDATED ONLY**.
4. TerritoryMaster__c, TerritoryName
   - These two fields are not being maintain in the **Account** object but should be mandatorily in the **UST** object.

TerritoryMaster__c	TerritoryName
a1c4N000001HshB	Electro All

Table 1.1: Default values for the Territory Master fields

B. Populating the correct UST record

We should keep in mind that **SFDC** is case sensitive, and **MS Excel** is not. For this, we must be extra careful in populating the correct IDs for UST records. Electro Team doesn't voluntarily provide the UST records to maintain, we must pull these manually on our end.

Additionally**, 18 characters** ID format is the safe one to use since we're populating data from scratch.

Below table is the list of most efficient steps on how to populate UST records:

Step No.	Action to perform
Step 1	After performing any changes in the **Account** object, export UST records from the current system data (you can use Salesforce Inspector, Data Loader or Workbench). Include all the required fields for **UST** object upon export, it is also better to add IsActive__c field.
Step 2	Concatenate store ID and store owner ID columns from the file provided by business. This will serve as the unique field for **Account** object to be use for lookup.
Step 3	Concatenate AccountID__c and UserID__c fields from the exported UST records. This will serve as the unique field for **UST** object to be use for lookup.
Step 4	Lookup the UST record IDs from the exported data using the unique fields you just created for both **Account** and **UST** objects. Once done, you can go continue to prepare your files to be uploaded.

Table 2.0: Steps on how to populate UST record IDs

Another procedure is to populate the UST record manually in **SFDC** by just going to **UST** tab and search for the record using account number and user code. Though this is not recommended for multiple data as this takes too much time. Note that if the store is newly created, then no need to do the steps mentioned and just create a new UST record for the new store.

Most common Errors, Causes & Workarounds

Electro UST records are quite sensitive and there are some matters we need to consider, but the errors that will be tackled in this section are just commonly encountered.

Error	Cause	Workaround
UserId is required	Validation Rule	Input values on UserId and UserCode__c fields
Cannot update account and user fields	Validation Rule	Re-create the UST records This means existing data should be deactivated If error persist, there's no other choice but to delete existing data permanently **IMPORTANT**: Backup first the existing data
Duplicate values	Existing record	Update existing data only Update using the duplicated IDs that will show up in the error message
Cannot gain exclusive access to the record	Uploading too many records	Set batch size and thread to "1" when uploading

Table 3.0: Common errors, causes and workarounds when uploading UST records

NOTE: For any unknown error, report first to the Operation Lead, then to SLM and lastly, to eBest Team.
