Overview

The objective of this document is to align the processes on how to properly maintain the Remained Rounder Requests Object in our Salesforce Organization. This will include some key points and step by step processes.

All about Remained Rounder Requests Object

Remained Rounder Requests which has an API name of **RemainedRounderRequests__c** is used to provide support to the **Rounder Request** object. The main purpose of this object is to determine on how many available requests the user can still accommodate in submitting rounder requests, it serves as a request storage for the **Rounder Request** object.

We maintain this object during monthly master data upload or when business team requested us to through normal ticket (it could be FR or INC). We need to maintain the **Remained Rounder Requests** object properly to make sure that the users can submit rounder requests without any problem.

How to maintain Remained Rounder Requests Object

Below is the current workflow that we follow when maintaining the **Remained Rounder Requests** object.

1. Business to provide template file containing the data needs to be maintain

	A	B	C	D	E	F	G
1	id	PeriodStartDate__c	PeriodEndDate__c	AccountNumber__c	TotalSpotl	TotalSpotl	IsActive__c
2		2022-07-01	2022-09-30	2003236154	17	100	TRUE
3		2022-07-01	2022-09-30	2003242577	17	100	TRUE

Image 1.0: Actual file template sample provided by business

NOTE: Business named the object from their side as **DisplayRounderMaster.**

2. Process the raw data submitted by business

Before proceeding, we have to make sure first if what action needs to be taken care of. Business doesn't indicate this in their file, and we have to check it manually from our end.

IMPORTANT: Checking if the record is for Create or Update

We can determine by simply looking up from the current data in the system and comparing it to the data from business. Golden rule on checking this is, **when a record already has existing data in the current system with the same *store* and *period dates* then the record is for Update. If record doesn't exist with the same store and *period dates*, hence it is for Create**.

The most effective way on doing this is to export the current system data and cross check with business' data using ***VLOOKUP*** function in **MS Excel**. The **Account Number** can be used as the ***unique field*** when doing this cross checking. Also, make sure to filter out correct dates to get only accurate data. When exporting current system data, it's up to the support person which extended Salesforce application he/she wants to use, but the below sample query can be used as a reference.

Query:	SELECT ID, AccountNumber__c, PeriodStartDate__c, PeriodEndDate__c FROM RemainedRounderRequests__c WHERE PeriodStartDate__c = 2022-09-01 AND IsActive__c = true

Table 1.0: Sample query to be used when exporting current system data

A. Maintaining the data from the backend

Below are the required fields that needs to be used when uploading the data in the backend. This is very useful when maintaining two or more records. This can be done either from Salesforce Inspector, Data Loader or Workbench.

API Name	Data Entity	Default Value	Comment
ID	ID	*Can be checked from the current system data*	Used for Update only
PeriodStartDate__c	Date	*Provided by business*	-
PeriodEndDate__c	Date	*Provided by business*	-
AccountNumber__c	Number	*Provided by business*	-
TotalSpotRounderDisplay__c	Number	*Provided by business*	-
TotalSpotRounderShelf__c	Number	*Provided by business*	-
IsActive__c	Text	TRUE	-

Table 2.0: Required fields to be used for Remained Rounder Requests object

B. Maintaining the data manually in Salesforce Platform

This can be used either for checking current system data or when updating the data. Very useful when only dealing with single record.

i. From the **Home** page, click on the **"+"** sign to open the **All Tabs** page. Click on **Remained Rounder Requests** object.

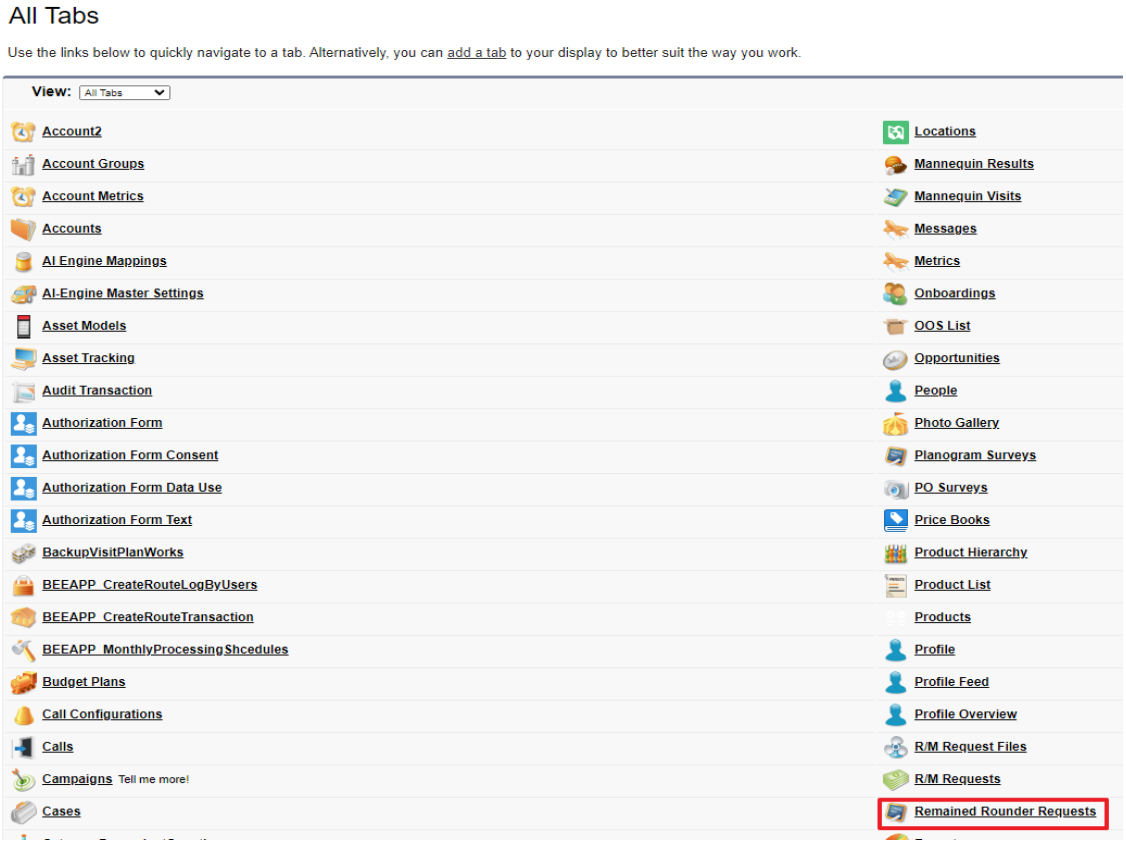

Image 1.0: Actual step 1 view

ii. To *Create* a new record, click on **New** and fill up required fields. Click **Save**.

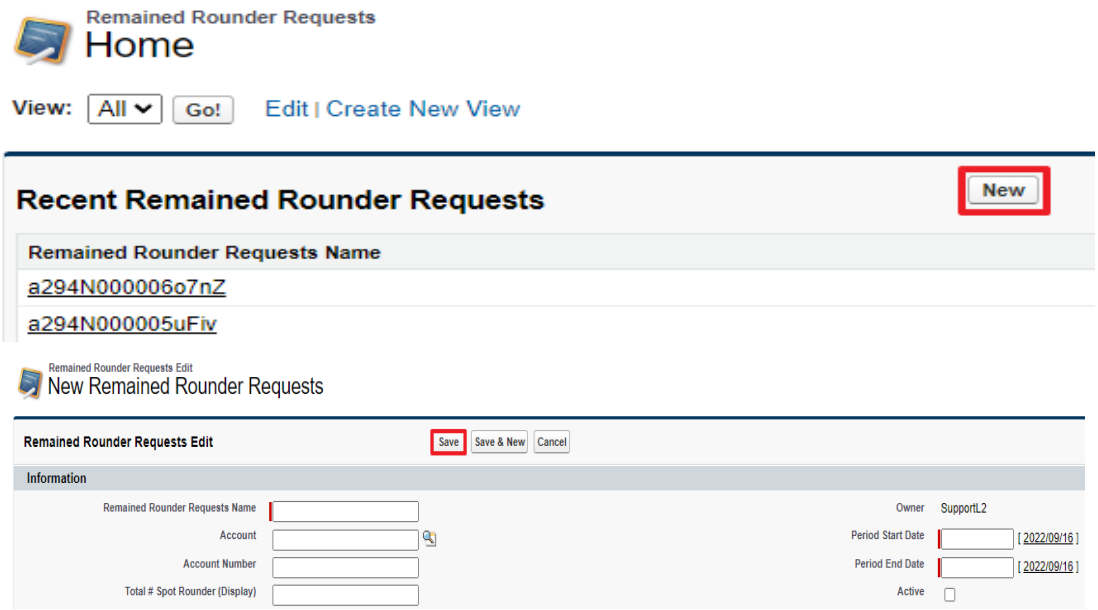

Image 1.1 – 1.2: Actual step 2 view

iii. To check existing data or to *Update*, click on **Edit** and input required fields. Click **Save** to search.

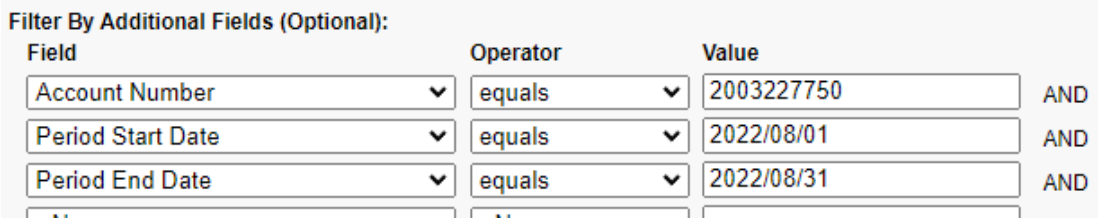

Image 1.3: Actual step 3 view

Open the searched record by clicking on the Remained Rounder Requests Name. Update only necessary data and click **Save** (similar process from step 2).

FAQ: Do we delete Remained Rounder Requests record?

As of the current workflow, we don't actually delete **Remained Rounder Requests** records. We can deactivate a record if only requested by business. Though records with past ***period dates*** are already considered inactive. There's still no limit on how many records we can pile up on this object, so leave them as is for now. If ever this logic will be changed in the future, further reviews and discussions will be needed.
